Flight editing

The next tab is Flight editing (which can also be found in Settings > Flight Editing). Here we have settings helping in the process of adding and editing flights. The most important ones at this stage are:

• **Disable permanent deleting of sectors** – this setting is ticked by default as we do not recommend permanent deleting of sectors (as it may result in irreversible loss of data) and rather using the option to cancel flights (that may later be restored) in the schedule.

• **Default trip type** - each added flight, when edited, will have a chosen type: PAX, Flight for Owner, Training flight, Simulator, Technical, Ambulance, Crew Private, Cargo. We recommend PAX for commercial flights.

• **Trip edit scheme** - allows to set PAX/Cargo or both as default values to be entered into the EDIT TRIP panel.

• **Check airport opening hours** - Leon can monitor airports opening hours and show a warning if you try to add a flight where STD/STA are outside the opening hours.

* Hide status for scheduled flights - flight status dot will be invisible for scheduled flights in OPS section page.

* **Show max range exceeding warning** - max aircraft range can be defined in an aircraft edition page.

• Allow not completed JL to be entered - this option allows you to add not completed Journey Log to the system after the flight (times only). This is for the rare cases when the Times in JL are needed for maintenance purposes when the aircraft is out of home base. Then the aircraft comes back to the home base after a number of days, the rest of the JL can be filled in.

* **Auto update expiry training date** - this setting will automatically update airport recency for the pilot given the checkbox "Airport recency" is marked in the Airport Directory and the journey logs are filled in correctly.

Checklist items

Checklists are very important parts for OPS and sales teams in the flight preparation process. They are like a TO-DO list before the flight can take place. Here you can select the items that will be later used when preparing the flight. Each of those will have a set of statuses that will allow seeing at which stage of preparation each item is.

The changes applied to this section will be applied to the next flight that is added to the system. In the Checklist, select the option +ADD ITEM to add a newly added item. This only needs to be done once. The item will be added to all following flights automatically.

Custom Delay Codes

Here you can define your own Delay Codes which then will be used in Journey Log and Flight Watch. All the other codes are sourced from the database.

Click below for a video tutorial on the above settings as well as some instructions on how to configure and send out GAR emails from Leon.
