

Fleet Documents

[Video Tutorial](#)

Admin > Fleet Documents Settings - the main screen view

Each aircraft requires specific **documents** to be operated. Most of them are mandatory (Certificate of Registration, Certificate of Airworthiness, Air Operator Certificate), some are supplementary (Certificate of Maintenance Review, Certificate of Fitness of Flight). Leon allows you to add and manage all the documents required and also add scans of paper documents.

If the aircraft document is **expired**, Leon will display a **warning** while adding the flight on the aircraft the document is issued for.

Documents definitions

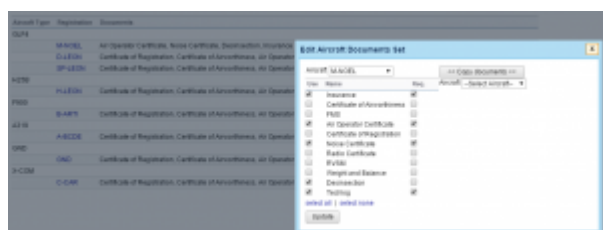

Defining new documents for fleet

Before you add any aircraft document in Leon, you need to customise the list of all fleet documents you want to use.

Go to Settings > Fleet Documents Setup and under the icon **Documents definitions** you will be able to add document name and document type.

By clicking on the icon  you can add another document. The window also allows you to change positions of documents, depending on their importance, by clicking green upward/downward arrows. Once the making of the list is finished, save changes.

Adding a new document to a particular tail

Adding newly defined document to a particular tail

Next step is adding documents to a particular aircraft, which can be done when clicking on aircraft registration. When a pop-up window **Edit aircraft Documents Set** shows up tick particular documents in column **Use** and **Req** (see screenshot on the right).

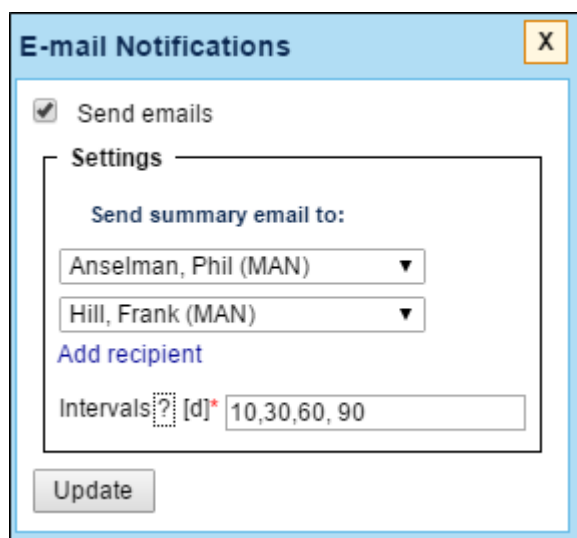

To make it easier, when it comes to adding the same band of documents to **all aircraft**, you can copy documents from already set up aircraft to the one that needs to have documents added. Go to unassigned aircraft, click **Copy documents**, choose the aircraft from which the import should be done and update.

It is also possible to add fleet documents to tails marked as **not used** (in aircraft profile) - Leon shows aircraft status in a column **Status**.

E-mail Notifications

It is a simple feature which allows you to define one or more persons who should be notified when aircraft document is going to be **expired**.

In a field **Intervals** you can add number of days when emails should arrive (as many as necessary - after comma).

The screenshot shows a window titled "E-mail Notifications" with a close button (X) in the top right corner. Inside the window, there is a checked checkbox labeled "Send emails". Below this is a "Settings" section. Under "Settings", there is a label "Send summary email to:" followed by two dropdown menus. The first dropdown menu shows "Anselman, Phil (MAN)" and the second shows "Hill, Frank (MAN)". Below the dropdowns is a link "Add recipient". At the bottom of the settings section is a text field labeled "Intervals [d]*" containing the text "10,30,60, 90". At the very bottom of the window is an "Update" button.
