

# AMOS export

The screenshot displays the 'AMOS export' report interface. On the left, a table lists flight data with columns for flight number, date, time, aircraft, and status. On the right, a filter panel allows users to select the type of schedule (Planned flights or Executed flights) and filter by date range and aircraft registration.

'AMOS export' report

**AMOS** is the MRO software used by airlines. More information about AMOS can be found [here](#)

The report allows downloading an XML file and uploading it to the AMOS servers.

The export can be performed based on:

- **Planned flights** - only planned flights included
- **Executed flights** - only completed flights with the Journey Log filled in (can be a partial Journey Log, ie timeframes inserted)

The option to select the **type of the schedule** to be exported can be **selected in the filter**.

Additionally, it is possible to filter by the date range and the aircraft registration. The filter is located in the top-right corner of the screen.

In order to download the file, click on the [Executed flights](#) link available in the top-left corner of the report.
