TLB - **Technical Log Book** is a section where you can add exact **TOFF** & **LNDG** times along with the number of cycles done by particular aircraft in the trip.

First step to using TLB is configuring start values for **TAH** and **TAC** calculations for each Aircraft that is subject to the calculations. These values will show in CAM data in Airframe section.

TLB - Technical Log Book

Once you have configured the aircraft you can start inputting data by **Adding new TLB entry**. The data inserted here can be used for **TAH** (Total Aircraft Hours) & **TAC** (Total Aircraft Cycles) calculations (if a checkbox 'Calculate TAH, TAC using TLB' is marked in Settings > General Settings'). The calculation is then displayed in Settings > Fleet section.

If you want Leon to show TAH & TAC data according to TLB details, go to section Settings > General Settings and mark a checkbox **Calculate TAH, TAC using TLB**.

When adding **new Maintenance**, you will be able to check TLB Limits for the day of the Maintenance, by clicking **Check** button and it will display as per below screenshot.

CAM limits											
TAH			TAC		Date						
Current on 30-04-2016 at 01:00											
Only confirmed flights:											
TAH	650:28	TAC	255								
All flights (including options):											
TAH	654:58	TAC	258								

You can sort data by TLB number or by time in the filter.
